DevKnowledge AI – Sample Project Document

Payment Gateway | API & Integration Guide | Sample data for upload testing

1. Project Overview

The Payment Gateway service handles payment initiation, payment status tracking, and payment confirmation for the DevKnowledge AI sample environment. This document is fictional and intended only for local development and upload testing.

2. Technology Stack

Frontend: React and Material UI
Backend: Node.js and Express
Database: MongoDB
Integration: REST APIs

3. Create Payment API

Endpoint: POST /api/payments
Content-Type: application/json

Sample request:

Field	Type	Description
orderId	String	Unique order identifier
amount	Number	Payment amount
currency	String	Currency code, e.g. INR
customerId	String	Customer identifier

3.1 Sample JSON

```
{
"orderId": "ORD-1001",
"amount": 1499.00,
"currency": "INR",
"customerId": "CUS-501"
}
```

4. Payment Status Values

PENDING – Payment has been initiated but not confirmed.
SUCCESS – Payment has been successfully completed.
FAILED – Payment processing failed.
REFUNDED – The payment amount has been refunded.

5. Troubleshooting

If an API request returns HTTP 400, check that all required fields are present and that amount is a valid number. For HTTP 401, verify the authentication token. For HTTP 500, inspect backend logs and check database connectivity. Never store real card numbers, CVV values, passwords, or production secrets in

project documents.
